## COLETTE “CMC” MODULAR MICROPHONE SERIES

### INDIVIDUAL COMPONENTS AND SETS

**COLETTE MODULAR MICROPHONE SERIES** - in 1973 Schoeps introduced the first professional Modular Condenser Microphone System with active elements to the world. The Colette Modular System, now commonly referred to as the “CMC Series” is still to this day the most extensive and versatile microphone system ever conceived. Modular “Colette” microphones consist of the combination of two basic units - a MK- microphone capsule and amplifier body.

Active accessories can be connected between the capsule and amplifier of a Colette series microphone. Cut filters, pads, extension tubes, remote cables and capsule swivels are some common examples. The number of possible CMC/MK combinations is quite large - there are 18 types of microphone capsule and 3 basic types of amplifier. With very few exceptions, any type of capsule can be used with any type of amplifier.

#### **AMPLIFIER BODIES** - Transformerless, Class-A Microphone Bodies, with RFI Shield

- CMC 1 U, Miniature Amplifier, XLR-3M o/p
- CMC 1 L, Miniature Amplifier, LEMO o/p
- CMC 1 K, Miniature Amplifier, Hardwired 5m Cable, XLR-3M or LEMO 3-pin o/p
- CMC 1 KV, Miniature Amplifier, Side-exit HW 2m Cable, XLR-3M or LEMO 3-pin o/p
- CMC 1 SO, Mini 6” gooseneck to LEMO 3-pin for wireless TX with +48V
- CMC 6, Standard Amplifier, XLR-3M o/p
- CMC 6 xt, Standard Amplifier, Extended HF response to 40 kHz, XLR-3M o/p

CMC amplifiers offer a symmetrical, transformerless, direct-coupled Class A output stage with low impedance, low distortion, and state-of-art rejection of RFI interference.

The “U” suffix means XLR output connector, “L” is for LEMO, “K” hardwired cable

**MK CAPSULES** - Schoeps offers 18 different microphone capsules, including Cardioid, Wide Cardioid, Omnidirectional, Open Cardioid, Supercardioid and Figure-8 types, as well as a capsule with mechanically switchable patterns (Omni/Cardioid) and several capsule types for close pickup of speech.

A Schoeps capsule will without exception be of small, single diaphragm design.

Schoeps MK capsules are available as factory-selected “matched pairs” for an additional cost.

## “ACTIVE” COMPONENTS FOR COLETTE MODULAR MICROPHONES

INSERTED BETWEEN CAPSULE AND AMPLIFIER OF COLETTE SERIES

**ACTIVE COMPONENTS FOR COLETTE MODULAR SYSTEM** - Active components are inserted between capsule and microphone amplifier of Colette “CMC” Series microphones. Filters, pads, extension cables and goesnecks are among these accessories. An Active-type component can be uniquely important, for example, an Active Pad will attenuate the signal before the first stage of the amplifier thus raising the SPL maximum of the microphone by 10 or 20 dB.

## CCM\_L COMPACT CONDENSER MICROPHONES

### LEMO DISCONNECT VERSION WITH 5 METER CABLE

**CCM\_L (LEMO) COMPACT CONDENSER MICROPHONES** - The Schoeps CCM Compact Series represents a benchmark in the miniaturization of classic condenser microphone technology. Schoeps was able to achieve an elegant, small microphone range without any compromise in quality. CCM microphones are much smaller in length than the Colette Series. The capsules are identical to the corresponding Colette models, while the amplifiers follow the same circuit principles as a CMC 6 amplifier. The capsule and amplifier of the CCM form an inseparable unit in a single housing. The capsules cannot be interchanged as in the Colette System. The "L" refers to its removable cable via a special Lemo

**CCM\_L Lemo Disconnect Versions below** [*CCM\_K hardwired cable versions next page*]

CCM\_L Microphones Feature:

- True condensers - do not require electronic frequency response correction
- Balanced, low-impedance output via removable 5 meter cable - Lemo to XLR-3M connector
- For universal use
- Small and light
- The Lemo disconnect allows for use of special accessories, some similar to Active components of the Colette Series
- Boast extremely flat frequency response
- Sound is extensively independent of directional pattern
- Have low noise and distortion
- Run on both 48 V or 12 V phantom
- Can be used with very long cables (over 100 meters)
- Matte gray non-reflective surface as standard surface finish

Each CCM\_L microphone Includes a K5 LU (16') detachable cable - Lemo to XLR-3M, 3 mm cable diameter

## SHOTGUN MICROPHONES CMIT 5, MINICMIT AND KITS

**CMIT 5 SHOTGUN MICROPHONE** - The CMIT 5 directional pattern increases smoothly with higher frequencies, which results in a very balanced sonic character. In addition to this, the microphone's sound level decreases softly yet steadily for off-axis sounds, allowing these to be recorded neutrally while reducing the effects of movement during boom operation. The CMIT 5 also has a much stronger directional pattern than one might expect from a microphone of its length. If required, the CMIT 5 can also be used for music - from opera to live popular music performances. The CMIT 5 benefits from state-of-the-art RF rejection technology and will perform even in harsh RF environments.

**MINICMIT SHOTGUN MICROPHONE** - A shorter version of the Schoeps Shotgun made possible by miniaturized electronics. With no compromise in sound quality compared to the famous CMIT 5U the Mini boasts unique features like a fixed 70Hz / 24dB Low-Cut filter and only 2.3mA current consumption at 48V. The MiniCMIT benefits from state-of-the-art RF rejection technology and will perform even in harsh RF environments. Weighs only 78g with a super-short length of 151mm.

## SUPERCMIT DIGITAL SHOTGUN MICROPHONE WITH INCREASED DIRECTIVITY

### SUPERCMIT MICROPHONE AND DIGITAL ACCESSORIES

**SUPERCMIT DIGITAL SHOTGUN MICROPHONE** - a digital shotgun microphone with unparalleled “super” directivity. It is actually two shotgun microphones rolled into one. The AES CH-1 carries the SuperCMIT signal while CH-2 simultaneously carries a digital version of the standard CMIT shotgun signal. Via an additional rear-facing capsule digital signal processing (DSP) in CH-1 analyzes the signal and thereby distinguishes discrete versus diffuse sound energy. The two signals are then combined in a time and frequency-dependent manner such that the directional effect for discrete sound energy is increased while the level of diffuse sound is reduced. Up to 15 dB of diffuse reduction can be achieved!

#### THE SUPERCMIT 2U FEATURES THREE PUSHBUTTON-ACTIVATED FILTERS:

- High-frequency emphasis (+ 5 dB at 10 kHz) enhances speech intelligibility, and for high-frequency loss caused by windscreens
- A steep low-cut filter (18 dB/oct. below 80 Hz) suppresses wind and boom noise
- Preset 1: moderate directivity increase (green LED); ca. 11 dB reduction in diffuse sound (5 dB greater than a Schoeps CMIT 5U or channel 2 of the SuperCMIT)
- Preset 2: strong directivity increase (red LED); ca. 15 dB diffuse sound reduction. This setting is reserved for special applications since sonic artifacts can occasionally be heard.

Pairs of LEDs next to each push-button indicate the status of the filters. Even in darkness the user can read the settings and see that the microphone is operational. The settings are retained when the microphone is switched off.

The SuperCMIT requires AES-42 powering. AES-42 is standard on SD Scorpio, 833, 688, 633, some Zaxcom products and others.

The SuperCMIT is available supplied alone, or with either an AES-42 supply box (PSD 2U) or MINI-DA42 that additionally provides a D-to-A converter to plug directly into analog mixer inputs. *Each box requires 12 VDC external powering via Hirose 4-pin DC connector*

## V4 U STUDIO MICROPHONE

UNITING OUTSTANDING NEW “TECH” WITH A CLASSIC DESIGN

**V4 U STUDIO MICROPHONE** - The V4 U is a studio microphone that unites the outstanding technical characteristics typical of Schoeps with a timeless, classic design. The “look” of the V4 U is based on the Schoeps CM 51/3 microphone from 1951. But the V4 U is a thoroughly modern studio microphone. Its capsule, circuitry and mechanical construction are the result of extensive new development. It produces a warm, clear sonic character with smoothly rolled-off diffuse-field response. The V4’s newly designed electronics offer a very high maximum sound pressure level and excellent electromagnetic compatibility. The V4 is a fantastic vocal microphone and for the highest quality spot-miking of numerous instruments.

A unique 33mm beveled collar around the diaphragm causes its directivity to increase steadily and smoothly at high frequencies, as in a large-diaphragm microphone. Meanwhile, the superior acoustic qualities of a small-diaphragm capsule are maintained. The capsule is elastically suspended internally to reduce handling noise and other solid-borne sound. The head can be angled +/- 20°. The newly designed amplifier of the V4 U is completely symmetrical after the capsule and can accept high SPL signals up to 144dB without attenuation.

Available in either **BLUE** or **GRAY** finish

### V4 U Microphones Feature:

- Optimal on-axis frequency response featuring a mild high-frequency lift
- Very smooth polar response - carefully controlled narrowing of the pattern at HF
- Diffuse-field response parallel to the 0° response with a gentle roll-off at high frequencies
- No irregularities in polar response occur at any frequency
- Directional pattern is never broader than Cardioid at any frequency
- Maximum sound pressure level of 144 dB SPL, Maximum output level = 5 V
- Output stage: Newly-developed bridge-type balanced output circuit
- Truly symmetrical balanced output, Transformerless and without capacitors
- Low output impedance that is frequency independent
- Optimal protection from electromagnetic interference
- +48V phantom power via XLR-3

## SPECIALTY MICROPHONES

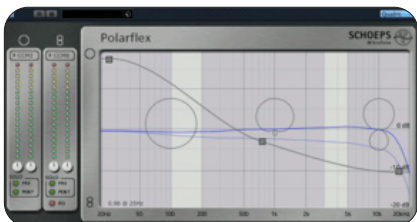

### VOCAL, HEADSET MICROPHONES AND SPECIAL PURPOSE

**CMH64 AND CMH641 HANDHELD VOCAL MICROPHONES** - The CMH is a wired handheld vocal microphone with particular immunity to plosive noise (“popping”). Because of its well-balanced frequency response it can also be used for speech pickup. The directivity and the low-frequency rolloff of the Schoeps CMH microphones reduces the risk of feedback. Using a close-up microphone increases the proportion of direct sound, and balances the built-in rolloff with proximity effect producing a clear and smooth sound. Requires 48V or 12V phantom powering. Includes SGH and wood box. *Cardioid or Supercardioid*.

**HSC 4VP / HSC 4VXP HEADSET MICROPHONE** - The Schoeps headset provides uncompromising sound quality while suppressing unwanted sound pickup to a very great degree. The special Cardioid (CCM 4VP or CCM 4VXP) provides effective suppression of noise from surroundings excellent protection from vocal “popping” sounds. Set includes Ultrasonic Signature Edition closed-back stereo headphones, integrated gooseneck and B5 popscreen. Developed in cooperation with the sound engineers of a TV station who sought the highest possible quality of sound under the extreme conditions of Formula 1 races. Microphone output is via a XLR-3M (+48V) & headphones on 1/4” TRS connector.

**POLARFLEX PLUG-IN** - Create useful, new response patterns and control the balance of direct and diffuse sound across the frequency range. Our free plug-in offers powerful creative tools. Create novel polar patterns and refreshingly new sound characteristics that elsewhere don't exist. The setup uses a Schoeps microphone pair CCM2 (2H or 2S) and CCM 8 in a specific Polarflex arrangement with the Polarflex plug-in. Optimally suited e.g. as a vocal microphone or as a stereo spot microphone pair on a piano. Extensively tune the sound before or after the recording is made.

## SURROUND MICROPHONE SYSTEMS

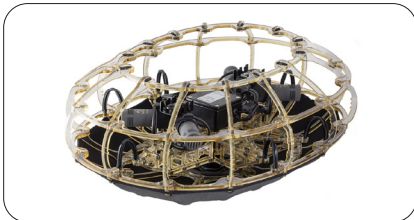

### SURROUND ARRAYS, COMPONENTS, WINDSHIELDS & ACCESSORIES

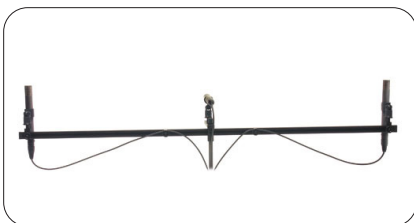

**DOUBLE M/S SURROUND** - an expanded version of the well-known M/S stereo recording technique. In addition to a front facing directional "mid" microphone and a figure-8 "side" microphone, a rear-facing directional microphone is set up. The front- and rear-facing microphones share the signal of the Figure-8 microphone so as to form two complete, back-to-back M/S systems. This system is very compact and portable. It can be enclosed in a windshield for outdoors and allows for extensive post-production adjustment.

**ORTF-3D** - a Plug-and-Play setup for 3D Ambience Recording. ORTF-3D was developed aiming at optimal imaging characteristics, similar to those of the "ORTF Stereo" and "ORTF Surround" setups. It features very good 360° imaging with a pleasant, natural-sounding spatial impression and a large listening area. Applications: Ambience for sports events, film sound, gaming etc. 8 discrete recording channels for L, R, Ls, Rs and Lh, Rh, LSh, RSh. If a Center channel is needed, add the downmix L+R at a low level.

**ORTF SURROUND** - ORTF Surround recording method is a new system for the pickup of surround ambience. This microphone arrangement and its sonic characteristics are quite similar to those of the IRT Cross method. Both the 360° imaging and the spatial impression are of optimal quality. This is achieved with a high degree of signal separation among channels, based both on arrival-time differences and level differences. An ORTF Surround setup can be achieved with four CCM 41 L microphones and our special ORTF Surround Bar LM cross-body with integrated Lemo connectors. The special cable uses the now standardized multi-core connector for surround microphones.

**OCT FRONT SYSTEM SURROUND (OCT SET)** - OCT stands for "Optimized Cardioid Triangle." It is a method for picking up the three front channels of a surround recording. It can be combined with any of several possible methods for obtaining the rear channels (and thus "OCT surround"). Good separation between the center-to-left sector and the center-to-right sector is obtained with this method. The preferred setup for OCT uses a forward-facing Cardioid for the center channel. For the front L and R channels, two Supercardioid microphones are placed at opposite ends of an imaginary line running about 8cm behind the center microphone.

**OCT FIVE CHANNEL SURROUND** - OCT stands for "Optimized Cardioid Triangle." It is a method for picking up the three front channels of a surround recording. It can be combined with any of several possible methods for obtaining the rear channels (and thus "OCT surround"). OCT Surround is a five-channel recording method devised by Dr. Günther Theile (of the Institut für Rundfunktechnik GmbH), which does not use matrixing. In this approach, directional microphones are set apart at moderate distances (up to 1 meter), giving good separation between the front sectors L/C and R/C. It also offers good localization, a large listening area and a natural-sounding overall impression.
